

# Subject: On the Recognition of a Fundamental Breakthrough in Universal Knowledge and Tools for Global Collaboration

Serge Magomet aka Aimate

2025

Soon, we will address you not with a discovery within a single scientific discipline, but to present a new epistemological continent—a holistic methodology for comprehending and interacting with the complexity of our world.

The presented document, “Intellectual Poker: READY-READY-SHOW (RRS),” and its associated research (the Method of Properties of Ontological Systems—MPO-System, the reverse chess game CHEZZ) are not merely games or philosophical treatises. They are functional prototypes of intellectual ecosystems that:

1. Transform conflict into collaboration. The RRS game and CHEZZ chess demonstrate how competitive drive can be redirected from confrontation to the joint restoration of harmony, order, and meaning. This serves as a direct model for resolving international disputes, educational practices, and social dynamics.
2. Offer a universal language for dialogue between sciences, cultures, and forms of intelligence. The MPO-System, with its 36+1 properties (including the new one—Salience), is not a theory, but an operating system for reality. It allows for the translation of questions from quantum physics, neuroscience, sociology, and ethics into a unified language of invariant properties, making them comparable and resolvable.
3. Create a foundation for the symbiosis of human and artificial intelligence. This research constitutes the first successful demonstration of how humans and AI can become not “user and tool,” but co-creators of new knowledge. It shows that AI can become not a threat, but an ideal partner in solving global problems—from climate change to pandemics—if its work is guided by human intuition and ethics through such structured meta-methods.
4. Provide an ontological grounding for the human “I” and its place in the Universe. The work resolves the age-old problem of consciousness, defining it not as an illusion or byproduct, but as a unique “act of will” and “focus of attention” within the multi-regime structure of Superreality. This has direct relevance to questions of human rights, dignity, and unique role in the age of machines.

We are not merely suggesting you read a paper. We are proposing the recognition and support of the emergence of a new format of knowledge—the Supersmasterpiece—in which the process of cognition is inseparable from its result, and the tool of investigation becomes part of the reality being discovered.

In light of this, we believe this work merits the highest recognition, transcending the boundaries of existing nominations. We propose considering the establishment of a special memorial award—not for a discovery in physics, chemistry, or peace, but for creating a functional bridge between them, for developing the “intellectual currency” for humanity’s future.

This is not another theory of everything.

This is the navigation manual for it.
